02.1: TCP, HTTP

TCP #1 (netstat, lsof, nc)

Run the command using sudo and take a screenshot of the output to include in your lab notebook.

```
hali5@instance-1:~$ sudo netstat -tlnp
Active Internet connections (only servers)
Proto Recv-Q Send-Q Local Address           Foreign Address         State       PID/Program name
tcp        0      0 0.0.0.0:22              0.0.0.0:*               LISTEN      502/sshd: /usr/sbin
tcp6       0      0 :::22                   :::*                     LISTEN      502/sshd: /usr/sbin
```

Note: This is done through Google Compute Engine VM because WSL2 does not provide any information when running the netstat -tlnp command.

For port numbers that are named, examine /etc/services and find the port number that corresponds to it. Include this mapping in your lab notebook.

```
ssh          22/tcp      # SSH Remote Login Protocol
```

For ports that only have a number, what service might it be providing based on the name of the program that is being run?

None of the ports on the Google Compute Engine VM only have a number.

Login to linux.cs.pdx.edu. Run the netstat command again, but do not use sudo as this is a machine managed by CAT. Include a screenshot of the output.

```
hali5@ada:~$ netstat -tlnp
(Not all processes could be identified, non-owned process info
 will not be shown, you would have to be root to see it all.)
Active Internet connections (only servers)

tcp6       0      0 :::1:6013                :::*                    LISTEN      -
tcp6       0      0 :::1:6014                :::*                    LISTEN      -
tcp6       0      0 :::1:6015                :::*                    LISTEN      -
tcp6       0      0 :::1:631                  :::*                    LISTEN      -
tcp6       0      0 :::1:25                   :::*                    LISTEN      -
hali5@ada:~$
```

What services does this machine provide for external access?

25 - Simple Mail Transfer Protocol

22 - SSH Remote Login Protocol

111 - Sun Remote Procedure Call

113 - Authentication service used in SUN Remote Procedure Call

631 - Internet Printing Protocol

Use the -i and the -s flag of lsof to generate a listing that is equivalent to the one generated with netstat previously and include it in your lab notebook

```
hali5@instance-1:~$ sudo lsof -i -s
COMMAND  PID    USER  FD   TYPE DEVICE SIZE NODE NAME
dhclient 327    root   9u    IPv4 10307      UDP *:bootpc
chronyd   399    _chrony 5u    IPv4 10377      UDP localhost:323
chronyd   399    _chrony 6u    IPv6 10378      UDP localhost:323
google_gu 402    root   11u   IPv4 11432      TCP instance-1.c.cloud-tran-hali5.internal:53192->metadata.google.internal:http (ESTABLISHED)
google_os 471    root   3u    IPv4 10448      TCP instance-1.c.cloud-tran-hali5.internal:53066->metadata.google.internal:http (ESTABLISHED)
sshd      502    root   3u    IPv4 10625      TCP *:ssh (LISTEN)
sshd      502    root   4u    IPv6 10627      TCP *:ssh (LISTEN)
sshd      572    root   4u    IPv4 10727      TCP instance-1.c.cloud-tran-hali5.internal:ssh->35.235.241.209:46261 (ESTABLISHED)
sshd      594    hali5   4u    IPv4 10727      TCP instance-1.c.cloud-tran-hali5.internal:ssh->35.235.241.209:46261 (ESTABLISHED)
hali5@instance-1:~$
```

Include for your lab notebook, the version of ssh that is being used.

SSH-2.0-OpenSSH_8.9p1

Throughput test

Show a screenshot of the measured bandwidth available between your us-west1-b VM and each of the other Compute Engine VMs. Explain the relative differences (or lack thereof) in your results.

```
hali5@vm-us-west1-b:~$ iperf -c 35.244.111.182 -p 80
-----
Client connecting to 35.244.111.182, TCP port 80
TCP window size: 85.0 KByte (default)
-----
[  3] local 10.138.0.12 port 47320 connected with 35.244.111.182 port 80
[ ID] Interval       Transfer     Bandwidth
[  3] 0.0-10.1 sec   171 MBytes   142 Mbits/sec
hali5@vm-us-west1-b:~$ iperf -c 35.195.135.81 -p 80
-----
Client connecting to 35.195.135.81, TCP port 80
TCP window size: 85.0 KByte (default)
-----
[  3] local 10.138.0.12 port 41350 connected with 35.195.135.81 port 80
[ ID] Interval       Transfer     Bandwidth
[  3] 0.0-10.1 sec   189 MBytes   157 Mbits/sec
hali5@vm-us-west1-b:~$ iperf -c 35.231.39.142 -p 80
-----
Client connecting to 35.231.39.142, TCP port 80
TCP window size: 85.0 KByte (default)
-----
[  3] local 10.138.0.12 port 46464 connected with 35.231.39.142 port 80
[ ID] Interval       Transfer     Bandwidth
[  3] 0.0-10.0 sec   416 MBytes   348 Mbits/sec
hali5@vm-us-west1-b:~$
```

The relative difference between the throughput and bandwidth of the connection to Australia, Europe, and US East VM's respectively are due to their distance from the client's VM (US-West). Australia, being the furthest, had the lowest throughput and bandwidth, followed by Europe which is the second farthest, and lastly US East, being the closest, had the highest throughput and bandwidth.

Developer Tools

First Request:

What is the URL being requested?

The URL being requested is <http://google.com>.

What is the HTTP status code in the response and what does it mean?

The HTTP status code in the response is 301 Moved Permanently which indicates that the requested resource has been definitely/permanently moved to the URL given by the location header in the response.

Second request:

What is the URL being requested? Is it using HTTP or HTTPS?

The URL being requested is <http://www.google.com/>. It is using HTTP.

**What are the Host: (HTTP 1.1) or :authority: (HTTP 2.0) headers sent by the browser?
What is the User-Agent: HTTP header that is sent?**

The authority header sent by the browser is google.com. The user-agent header that is sent is *Mozilla/5.0 (X11; Linux x86_64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/112.0.0.0 Safari/537.36*

What is the HTTP status code in the response and what does it mean? Is it different from the first status code? If so, what is the semantic difference?

The HTTP status code in the response is a 307 Internal Redirect. This status code means the resource requested has been temporarily moved to the URL given by the location header and

commands the browser to redirect to that new URL. Yes, it is different from the first status code (301 Moved Permanently).

Show the associated HTTP response header that is sent in conjunction with this status code for the request.

| Name | Headers | Preview | Response | Initiator | Timing |
|------------------------------------|--|---------|----------|-----------|--------|
| google.com | General Request URL: http://www.google.com/ Request Method: GET Status Code: 307 Internal Redirect Referrer Policy: strict-origin-when-cross-origin | | | | |

| gen_204?atyp=i&ei=UJo3ZMSvLdq... | | | | | |
| rs=ACT90oFrQJy9luBhsVPpFkxrfIB... | | | | | |

Third Request:

What is the URL being requested? Is it using HTTP or HTTPS?

The URL being requested is <https://www.google.com/>. It is using HTTPS.

What is the HTTP status code in the response?

The HTTP status code in the response was 200 Ok status which means the request was successful and the server was able to fetch and deliver what was needed (web page in this case).

Look for an alt-svc: HTTP response header. Does the server believe the client can use HTTP3/QUIC?

Yes, the server believes the client can use HTTP3/QUIC. The value of the alt-svc key is `h3=":443"; ma=2592000,h3-29=":443"; ma=2592000`

Examine the HTTP response headers for cookies. Show the cookies that are set and which ones specify that no SameSite restrictions are in place. What does the setting indicate about the cookies that are set?

The cookies that were sent by the HTTP response as well as the ones that specify that no SameSite restrictions are in place was: *IP_JAR=2023-04-13-01; expires=Sat, 13-May-2023 01:07:37 GMT; path=/; domain=.google.com; Secure; SameSite=none*

The SameSite=None setting indicates that the cookie that is set is designated for cross-site access, meaning external resources on the web page may access the cookie despite the domain name of that cookie not matching the site domain name.

Asynchronous HTTP requests

Show the requests and responses in the listing. Click on the last request sent, then click on the response to see that its payload has returned the data that is then rendered on the search page similar to what is shown below for "rabbid"

The screenshot shows a Google search page for "Portland State". The search results list several items, including "Portland State University", "Portland State Vikings men's basketball", "portland state library", "portland state university academic calendar", "portland state university jobs", "portland state bookstore", "portland state university tuition", "Portland State Vikings football", "Portland State Vikings women's basketball", and "portland state university spring break 2023".

The Chrome DevTools Network tab is open, showing a list of requests. The last request is selected, and its response is visible in the right pane. The response is a JSON object containing information about the "Portland State University" search results, including the name, location, and a list of related items.

A Notepad window is also open, showing the text "hali5".

02.2: DNS, Recap

DNS #1 (dig)

Use dig to query the local DNS server for the A record of **www.pdx.edu** using TCP. Then, use dig to do the same for the MX record of **pdx.edu**. What do the ANSWER sections explain about where PSU's web/mail services are run from?

The ANSWER sections explain that PSU's web services are run from a single server since there is a single IP address for the result of **www.pdx.edu**, while PSU's mail services are run multiple Google servers for

Find the authoritative server (NS record type, AUTHORITY section response) for **mashimaro.cs.pdx.edu** and then query that server for the A record of **mashimaro.cs.pdx.edu**. Show both.

```
hali5@ada:~$ dig @127.0.0.53 -t NS mashimaro.cs.pdx.edu +tcp

```

When a web request hits port 80 of 131.252.220.66, how does the server know which site to serve from? (i.e. what protocol header)

The server knows which site to serve from by examining the Host header within the HTTP request.

Include the results of each query for your lab notebook (DNS iterative lookups)

```

```

Reverse DNS lookups

Use a single command line with commands `dig`, `egrep`, and `awk`, to list all IPv4 addresses that `espn.go.com` points to.

Take that list and create a single for loop in the shell that iterates over the list and performs a reverse lookup of each IP address to find each address's associated DNS name. As with the previous step, pipe the output of the for loop to `egrep` and `awk` so that the output consists only of the DNS names.

```

hali5@ada:~$ dig espn.go.com | egrep ^espn.go.com | awk '{print $5}'
18.65.229.93
18.65.229.26
18.65.229.61
18.65.229.14
hali5@ada:~$ X=`dig espn.go.com | egrep ^espn.go.com | awk '{print $5}'`
hali5@ada:~$ for i in `echo $X`; do dig -x $i | egrep server | awk '{print $5}'; done
server-18-65-229-61.sea73.r.cloudfront.net.
server-18-65-229-26.sea73.r.cloudfront.net.
server-18-65-229-14.sea73.r.cloudfront.net.
server-18-65-229-93.sea73.r.cloudfront.net.

```

Host enumeration

```
hali5@ada:~$ for ip in {0..255}; do dig -x 131.252.220.$ip; done | egrep cs.pdx.edu | awk '{print $5}' > 220hosts.txt
hali5@ada:~$ cat 220hosts.txt | head -1000 | tail -1000

```

The screenshot does not show all of the results of the 220hosts text file, only a snippet since it is quite large.

DNS #2 (Geographic DNS)

What geographic locations do ipinfo.io and DB-IP return?

The geographical location that ipinfo.io and DB-IP return for the IP address of the DNS servers 131.252.208.53 and 198.82.247.66 were Oregon, USA and Virginia, USA respectively.

Record each result for your lab notebook.

```

htran@DESKTOP-01BI236:~$ dig @131.252.208.53 www.google.com

```

What is the geographic distance between each pair of DNS server and web server?

The geographical distance between the Oregon DNS server and the Seattle Washington Google server is 170 miles and the distance between the Virginia DNS server and Seattle Washington Google server is over 2,500 miles.

Do the routes reveal any information on the accuracy of the geographic locations given?

Yes, the traceroute verifies the accuracy of the geographical locations given by the number of hops that the data packet travels to. For the IP address of servers located in Oregon, there were less hops than that of the server located in Virginia which is due to the distance of the server. This result was also true for the IP address resolved for www.google.com.

Perform traceroutes on all 4 IP addresses.

```

hali5@ada:~$ traceroute 131.252.208.53

Collect and analyze the network trace of a connection

Take a screenshot of the trace within Wireshark and include an annotation of the packets in the trace to explain the purpose of each of the packets being exchanged.

The screenshot shows a Wireshark network trace with a display filter of 'eth0'. The packet list shows 24 packets. Packets 2, 3, 4, and 5 are DNS queries and responses. Packets 6 through 23 are HTTP traffic, including a GET request and several responses. Packet 24 is an ARP request. A Notepad window titled 'odinID - Notepad' is open in the foreground, displaying the text 'hali5'.

Frame 1: 42 bytes on wire (336 bits), 42 bytes captured (336 bits) on interface eth0, id 0
Interface id: 0 (eth0)
Encapsulation type: Ethernet (1)
Arrival Time: Apr 16, 2023 16:41:01.009549807 PDT
[Time shift for this packet: 0.000000000 seconds]
Epoch Time: 1681688461.009549807 seconds
[Time delta from previous captured frame: 0.000000000 seconds]
[Time delta from previous displayed frame: 0.000000000 seconds]
[Time since reference or first frame: 0.000000000 seconds]
Frame Number: 1
Frame Length: 42 bytes (336 bits)
Capture Length: 42 bytes (336 bits)
[Frame is marked: False]
[Frame is ignored: False]
[Protocols in frame: eth:ethertype:arp]
[Coloring Rule Name: ARP]
[Coloring Rule String: arp]
Ethernet II, Src: Microsoft.70:39:af (00:15:5d:70:39:af), Dst: Broadcast (ff:ff:ff:ff:ff:ff)
Destination: Broadcast (ff:ff:ff:ff:ff:ff)
Source: Microsoft.70:39:af (00:15:5d:70:39:af)
Type: ARP (0x0806)
Address Resolution Protocol (request)
Hardware type: Ethernet (1)
Protocol type: IPv4 (0x0800)
Hardware size: 6
Protocol size: 4
Opcode: request (1)
Sender MAC address: Microsoft.70:39:af (00:15:5d:70:39:af)
Sender IP address: 172.29.58.175
Target MAC address: 00:00:00:00:00:00 (00:00:00:00:00:00)
Target IP address: 172.29.48.1

How many DNS requests are made?

4 DNS requests were made.

How many TCP connections does the browser initiate simultaneously to the site?

The browser initiates 14 TCP connections simultaneously to the site.

How many HTTP GET requests are there for embedded objects?

There are 1 HTTP GET request for embedded objects.
